

Bookmarks with preview

This is a **concept drawing for the Camino browser**. I added a preview pane to the bookmarks viewer (which I co-wrote the original code for). I was inspired in part by the "now playing" pane in iTunes video podcasts, as shown in the thumbnail at right.

When you click on a bookmark, the preview pane will load and display the site as it currently appears.

Technical details: probably this would be easiest to implement as an off screen gecko canvas, which is then scaled and mirrored somehow in the preview pane. There would be just one preview pane associated with each window (just like the bookmarks display). The deactivate button would stop it from fetching and rendering pages, so that dialup users won't have to log in to browse their bookmarks.
